

VACCINE SHOTS: PREVENTION OR POISON?

According to Dr. Ratajezak, the increase of autism coincided with the introduction of human tissue in vaccines in the 1940's. She also stated that 23 vaccines used today have human DNA tissue. She further stated that a spike in autism after 1995 coincided with the human fetal tissue that was used in the chickenpox vaccine. She also stated that when a child's body is going through homologous Recombination (DNA repair and restructuring) their body is open to DNA insertion.

Which Vaccines contain Human Protein & DNA?

Fetal Cell Line **RA 27/3**

Given its name because the rubella virus was isolated from the 27th aborted fetus sent to the *Wistar* Institute in the 1964 rubella outbreak. **Vaccines:** Chickenpox, MMR (*ProQuad*)

Fetal Cell Line **WI 38**

Derived by L. Hayflick from the lung tissue of a 3-month old aborted human female fetus. **Vaccines:** MMR(MMR11), Chickenpox (*Varivax & ProQuad*), MMR (*ProQuad*)

Fetal Cell Line **MRC-5 cell line**

Developed in September 1966 from lung tissue taken from a 14 week fetus aborted for psychiatric reasons from a 27 year old physically healthy woman. MRC-5 is a known source of human DNA in vaccines. **Vaccines:** *Chicken pox (Varivax & ProQuad), Hepatitis A (Havrix & Vaqta), Dtap, Hib, Polio (Pentacel), Rabbits. (RabAvert)*

Human Albumin **From Human Blood**

Currently, only the MMR vaccine contains genetically engineered human protein, which is produced under the brand name "Recombumin" and referred to as "recombinant human albumin" in the package insert. **Vaccines:** *Chickenpox & MMR (Proquad), Rabbits (Rabvert)*

Genetically Engineered **Human Albumin derived from yeast**

Currently, only the MMR vaccine that contains genetically engineered human protein, which is produced under the brand name "Recombumin" and referred to as "recombinant human albumin" in the package insert. **Vaccines:** MMR11

Human DNA **Chicken pox & MMR (ProQuad), Chicken pox (Varivax) Hepatitis A (Vaqta)**
